Normal Distribution

The Normal Probability Distribution is very common in the field of statistics. Whenever you measure things like people's height, weight, salary, opinions or votes, the graph of the results is very often a normal curve.

OBSERVE OPTIMIZE OUTSPREAD

Properties of a Normal Distribution:

- (i) The normal curve is symmetrical about the mean
- (ii) The mean is at the middle and divides the area into halves.
- (iii) The total area under the curve is equal to 1.

(iv) It is completely determined by its mean and standard deviation σ (or variance σ^2).

Note:

In Normal distribution only two parameters are needed, namely μ and σ^2

Area under the Normal Curve using Integration:

The Probability of a continuous normal variable X found in a

particular interval [a, b] is the area under the curve bounded by x = a and x = b

is given by
$$P(a < X < b) = \int_{a}^{b} f(X) dx$$

and the area depends upon the values μ and σ .

The standard Normal Distribution:

We standardize our normal curve, with a mean of zero and a standard

LAM, KANYA

deviation of 1 unit.

If we have the standardized situation of $\mu = 0$ and $\sigma = 1$ then we have

$$f(x) = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}$$

We can transform all the observations of any normal random variable X with mean μ and variance σ to a new set of observations of another normal random variable Z with mean 0 and variance 1 using the following transformation:

$$Z = \frac{X - \mu}{\sigma_{\rm M}}$$

The two graphs have different μ and σ , but have the same area.

The new distribution of the normal random variable z with mean 0 and variance 1 (or standard deviation 1) is called a Standard normal distribution.

Formula for the Standardized normal Distribution

If we have mean μ and standard deviation σ , then

$$Z = \frac{X - \mu}{\sigma}$$

Find the moment generating function of Normal distribution

Solution:

We first find the M.G.F of the standard normal distribution and hence find mean

×/

$$\phi(z) = \frac{1}{\sqrt{2\pi}}e^{\frac{-z^2}{2}}; -\infty < z < \infty$$
where $z = \frac{x+\mu}{\sigma}$

$$M_z(t) = E[e^{tz}]$$

$$= \int_{-\infty}^{\infty} e^{tz} \phi(z) dz$$

$$= \int_{-\infty}^{\infty} e^{tz} \frac{1}{\sqrt{2\pi}} e^{\frac{z^2}{2}} dz$$

$$= \int_{-\infty}^{\infty} e^{tz} \frac{1}{\sqrt{2\pi}} e^{\frac{z^2}{2}} dz$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-(\frac{z^2-2tz}{2})} dz$$

$$=\frac{1}{\sqrt{2\pi}}\int_{-\infty}^{\infty}e^{-\left(\frac{(z-t)^2-t^2}{2}\right)}dz = \frac{1}{\sqrt{2\pi}}\int_{-\infty}^{\infty}e^{-\left(\frac{(z-t)^2}{2}\right)+\frac{t^2}{2}}dz$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\left(\frac{(z-t)^2}{2}\right)} e^{\frac{t^2}{2}} dz$$

$$= \frac{e^{\frac{t^2}{2}}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\left(\frac{z-t}{\sqrt{2}}\right)^2} dz = \frac{e^{\frac{t^2}{2}}}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-v^2} \sqrt{2} dv$$

$$= \frac{e^{\frac{t^2}{2}}}{\sqrt{\pi}} \int_{-\infty}^{\infty} e^{-v^2} dv = \frac{e^{\frac{t^2}{2}}}{\sqrt{\pi}} \sqrt{\pi} \text{ SINEER}$$

$$M_z(t) = e^{\frac{t^2}{2}} \dots \dots (1)$$

$$M_X(t) = M_{\mu+\sigma z}(t); \sum z = \frac{X-\mu}{\sigma}, X = \mu + \sigma z$$

$$= e^{\mu t} M_z(\sigma t)$$

$$= e^{\mu t} \cdot e^{\frac{\sigma^2 t^2}{2}} \text{ From (1)}$$

To find mean and variance:

$$OBSERVE OPTIMIZE OUTSPREND$$

$$= 1 + \frac{\mu t + \frac{\sigma^2 t^2}{2}}{1!} + \frac{\left(\mu t + \frac{\sigma^2 t^2}{2}\right)^2}{2!} + \cdots$$

$$= 1 + \frac{\mu t + \frac{\sigma^2 t^2}{2}}{1!} + \frac{\left(\mu^2 t^2 + \frac{\sigma^4 t^4}{4} + 2\mu t \frac{\sigma^2 t^2}{2}\right)}{2!} + \cdots$$

Coefficient of $t = \mu$ Coefficient of $t^2 = \frac{\sigma^2}{2} + \frac{\mu^2}{2}$

Problems based on Normal distribution ZE OUTSPREAD

1. Let X is normally distributed with mean 12 and SD is 4. Find the probability that (i) $X \ge 20$ (*ii*) $X \le 20$ (*iii*) $0 \le X \le 12$.

Solution:

Given X follows normally distribution with $\mu = 12$, $\sigma = 4$

$$P(X \ge 20) = P\left(\frac{X-\mu}{\sigma} \ge \frac{20-\mu}{\sigma}\right) = P\left(Z \ge \frac{20-12}{4}\right)$$

 $P(X \le 20) = 0.9772$

(ii)
$$P[0 \le X \le 12] = P\left(\frac{0-\mu}{\sigma} \le \frac{X-\mu}{\sigma} \le \frac{12-\mu}{\sigma}\right)$$

$$= P\left(\frac{0-12}{4} \le Z \le \frac{12-12}{4}\right)$$

 $= P(-3 \le Z \le 0)$

$$= P(0 \le Z \le 3)$$
 (since the curve is symmetrical)

 $P[0 \le X \le 12] = 0.4987$ (from the table)

2. In a normal distribution 31% of the items are under 45 and 8% are over64. Find the mean and the standard deviation.

Solution:

Let the mean and standard deviation of the given normal distribution be μ and . The area lying to the left of the ordinate at x = 45 is 0.31. The corresponding value of z is negative.

The area lying to the right of the ordinates up to the mean is 0.5 - 0.31 = 0.19

The value of z corresponding to the area 0.19 is 0.5 nearly.

$$\therefore \frac{45-\mu}{\sigma} = -0.5$$

(or) $-0.5\sigma + \mu = 45 \dots \dots \dots \dots \dots \dots \dots \dots (1)$

Area to the left of the ordinate at x = 64 is 0.5 - 0.08 = 0.42 and hence the value of z corresponding to this area is 1.4 nearly.

$$\therefore \frac{64-\mu}{\sigma} = 1.4$$

 $\frac{1}{\sigma}$ (or) $1.4\sigma + \mu = 64 \dots (2)$

$$(1)-(2)$$

$$-0.5\sigma + \mu = 45$$

$$(1.4\sigma + \mu = 64$$

$$-1.9\sigma = -19$$

$$\Rightarrow \sigma = 10$$

Substituting $\sigma = 10$ in (1) we get

 $-0.5(10) + \mu = 45$

$$x^{5} + \mu = 45$$

 $\Rightarrow \mu = 50$

3. The weekly wages of 1000 workmen are normally distributed around a mean of Rs. 70 with a S.D of Rs. 5. Estimate the number of workers whose weekly wages will be (i) between Rs.69 and Rs.72 (ii) less than Rs.69 (iii) more

than Rs.72

Solution:

Let X be the RV denoting the weekly wages of a worker

Given
$$\mu = 70, \sigma = 5$$

ULAM, KANYAK

Out of 1000 work men, the number of workers whose wages lies between Rs. 69 and Rs.72

$$= 1000 \text{ x P}(69 < X < 72)$$

$$= 1000 \ge 0.2347 = 235$$

(ii) P(less than 69) = P (X < 69)

When x = 69, $z = \frac{X-\mu}{\sigma} = \frac{69-70}{5} = -0.2$

Out of 1000 workmen, the number of workers whose wages are less than Rs. 69

= 420.7

(iii) P(more than Rs. 72) = P(X > 72)

When x = 72, $z = \frac{X-\mu}{\sigma} = \frac{72-70}{5} = -0.2$

$$P(X < 69) = P(z < -0.2)$$
$$= 0.5 - P(0 < z < 0.2)$$
$$= 0.4207$$

Out of 1000 workmen, the number of workers whose wages are less than Rs. 69
