### VOGEL APPROXIMATION METHOD

#### INTRODUCTION

VAM is an improved version of the least cost method that generally produces better solutions. The steps involved in this method are:

**Step : 1 :** Find the cells having smallest and next to smallest cost in each row and write the difference (called penalty) along the side of the table in row penalty.

**Step : 2 :** Find the cells having smallest and next to smallest cost in each column and write the difference (called penalty) along the side of the table in each column penalty.

**Step : 3 :** Select the row or column with the maximum penalty and find cell that has least cost in selected row or column. Allocate as much as possible in this cell. If there is a tie in the values of penalties then select the cell where maximum allocation can be possible

**Step : 4 :** Adjust the supply & demand and cross out (strike out) the satisfied row or column.

**Step : 5 :** Repeat this steps until all supply and demand values are 0.

**Problem 5: Find Solution using Vogel's Approximation method, also find optimal solution using modi method**

|        | D1 | D2 | D3 | D4 | D5 | Supply |
|--------|----|----|----|----|----|--------|
| S1     | 5  | 8  | 6  | 6  | 3  | 8      |
| S2     | 4  | 7  | 7  | 6  | 5  | 5      |

| Demand | 4  | 4  | 5  | 4  | 8  |        |

**Solution:**

Problem Table is

|        | <i>D1</i> | <i>D2</i> | <i>D3</i> | <i>D4</i> | <i>D5</i> | Supply |
|--------|-----------|-----------|-----------|-----------|-----------|--------|

| S2     | 4         | 7         | 7         | 6         | 5         | 5      |
| S3     | 8         | 4         | 6         | 6         | 4         | 9      |
| Demand | 4         | 4         | 5         | 4         | 8         |        |

Here Total Demand = 25 is greater than Total Supply = 22. So We add a dummy supply constraint with 0 unit cost and with allocation 3.

The minimum total transportation cost =  $3 \times 8 + 4 \times 4 + 6 \times 1 + 4 \times 4 + 6 \times 2 + 6 \times 3 + 0 \times 3 = 92$

Here, the number of allocated cells = 7, which is one less than to  $m + n - 1 = 4 + 5 - 1 = 8$

∴ This solution is degenerate

To resolve degeneracy, we make use of an artificial quantity(d).

The quantity d is assigned to that unoccupied cell, which has the minimum transportation cost.

The quantity d is assigned to S3D5, which has the minimum transportation cost = 4.
