

## COULOMB'S LAW

Coulomb's law is formulated in 1785 by French colonel, Charles Augustin de Coulomb. It deals with a force exerts on a point charge due to another point charge. Charges are generally measured in coulombs, one coulomb =  $6 \times 10^{18}$  electrons; one electron  $e = -1.609 \times 10^{-19}$ .

### STATEMENT :

The force between two point charges  $Q_1$  and  $Q_2$  is

- Along the line joining them
- Directly proportional to the product  $Q_1 Q_2$  of the charges
- Inversely proportional to the square of the distance  $R$  between them.

Mathematically expressed as  $F = \frac{K Q_1 Q_2 a_R}{R^2}$  (1)

$K \rightarrow$  Proportionality constant,  $Q_1, Q_2 \rightarrow$  charges in coulombs (C),

$R \rightarrow$  distance in meters (m),  $F \rightarrow$  Force in newton (N)

$$K = \frac{1}{4\pi\epsilon_0} = 9 \times 10^9 \text{ m/F}$$

$\epsilon_0 \rightarrow$  Permittivity of free space (in farads per meter)

$$\epsilon_0 = 8.854 \times 10^{-12} \approx \frac{10^{-9} \text{ F}}{36\pi \text{ m}}$$

Substitute  $K$  in equation (1), Equation (1) becomes

$$F = \frac{Q_1 Q_2 a_R}{4\pi\epsilon_0 R^2} \quad (2)$$

If the point charge  $Q_1$  and  $Q_2$  have a position vectors  $r_1$  and  $r_2$ , then the force  $F$  is represented as  $F_{12}$

$$F_{12} = \frac{Q_1 Q_2}{4\pi\epsilon_0 R^2} a_{R_{12}} \quad (3)$$

$$\text{Where } R_{12} = r_2 - r_1 \quad (4)$$

$$\text{Magnitude } R = |R_{12}| \quad (5)$$

$$\text{Unit vector } a_{R_{12}} = \frac{R_{12}}{R} \quad (6)$$

Substitute eqn (6) in eqn (3)

$$F_{12} = \frac{Q_1 Q_2}{4\pi\epsilon_0 R^3} R_{12} \quad (7)$$

Substitute eqn (4) in eqn (7)

$$F_{12} = \frac{Q_1 Q_2 (r_2 - r_1)}{4\pi\epsilon_0 |r_2 - r_1|^3} \quad (8)$$

Fig 18 : Coulomb vector force on point charges Q1 and Q2

1. The force on Q1 due to Q2 is  $F_{21} = |F_{12}|a_{R_{21}} = |F_{12}|(-a_{R_{12}})$

$$F_{21} = -F_{12} \quad (8)$$

$$a_{R_{21}} = -a_{R_{12}}$$

Fig 19: a,b, - Like charges repel ; c- Unlike charges attract.

2. Like charges repel each other while unlike charges attract.
3. The distance R between the charges Q1 and Q2 must be large compared with the dimensions of Q1 and Q2.
4. Q1 and Q2 must be static ( at rest).
5. The signs of Q1 and Q2 must be taken into account in eqn (3).

### Force due to N – point charges : ( Principle of Super position)

If more than two point ( N point) charges  $Q_1, Q_2, Q_3, \dots, Q_N$  are located with position vectors  $r_1, r_2, r_3, \dots, r_N$ , the force on charge Q located at point r is the vector sum of the forces exerted on q by each of the charges  $Q_1, Q_2, Q_3, \dots, Q_N$ .

$$F = \frac{Q Q_1 (r-r_1)}{4\pi\epsilon_0 |r-r_1|^3} + \frac{Q Q_2 (r-r_2)}{4\pi\epsilon_0 |r-r_2|^3} + \dots \frac{Q Q_N (r-r_N)}{4\pi\epsilon_0 |r-r_N|^3} \quad (9)$$

The above equation can also be written as

$$F = \frac{Q}{4\pi\epsilon_0} \sum_{k=1}^N \frac{Q_k (r-r_k)}{|r-r_k|^3} \quad (10)$$

## Electric Field intensity :

The electric field intensity (or electric field strength ) E is the force per unit charge when placed in the electric field.

$$E = \lim_{Q \rightarrow 0} \frac{F}{Q} \quad (11)$$

$$E = \frac{F}{Q} \quad (12)$$

The electric field intensity E is in the direction of the force F and is measured in newtons/ coulomb or volts / meter. The electric field intensity at point r due to point charge located at r' is obtained from eqn ( 8) and eqn ( 12)

$$E = \frac{Q}{4\pi\epsilon_0 R^2} a_R = \frac{Q (r-r')}{4\pi\epsilon_0 |r-r'|^3} \quad (13)$$

For N point charges  $Q_1, Q_2, Q_3, \dots, Q_N$  are located with position vectors  $r_1, r_2, r_3, \dots, r_N$  the electric field intensity at point r is obtained from eqn (10) and ( 12)

$$E = \frac{Q_1 (r-r_1)}{4\pi\epsilon_0 |r-r_1|^3} + \frac{Q_2 (r-r_2)}{4\pi\epsilon_0 |r-r_2|^3} + \dots \frac{Q_N (r-r_N)}{4\pi\epsilon_0 |r-r_N|^3} \quad (14)$$

$$E = \frac{1}{4\pi\epsilon_0} \sum_{k=1}^N \frac{Q_k (r-r_k)}{|r-r_k|^3} \quad (15)$$

## Electric fields due to continuous charge distributions

Point charge	Line charge	Surface charge	volume charge
-----------------	----------------	-------------------	------------------

Fig 20. Various charge distributions and charge elements

➤ Charge distribution is continuous along a line, surface & volume.

$dQ \rightarrow$  charge element

Total charge  $dQ = \rho_L dl$

$$Q = \int \rho_L dl \text{ (line charge)}$$

$$dQ = \rho_s ds \text{ (Surface charge)}$$

$$Q = \int_s \rho_s ds$$

Volume charge

$$dQ = \rho_v dv$$

$$Q = \int_v \rho_v dv$$

The electric field intensity due to  $\rho_L, \rho_s, \rho_v$

$$E = \frac{F}{Q} = \frac{Q (r-r')}{4\pi\epsilon_0 |r-r'|^3} = \frac{Q a_R}{4\pi\epsilon_0 R^2}$$

$$E = \frac{\int_L \rho_L dL}{4\pi\epsilon_0 R^2} a_R \text{ (Line charge)}$$

$$E = \int_s \frac{\rho_s ds}{4\pi\epsilon_0 R^2} a_R \text{ (Surface charge)}$$

$$E = \int_v \frac{\rho_v dv}{4\pi\epsilon_0 R^2} a_R \text{ (Volume Charge)}$$

## Electric field intensity of Line charge ( Finite and infinite Line Charge)

24 f

ELECTRO MAGNETIC FIELDS

Fig 21: Evaluation of the E field due to a line charge

Line charge with uniform distribution from A to B along z axis

The charge element  $dQ$  associated with element  $dl = dz$

$$dQ = \rho_L dL = \rho_L dz \quad \dots\dots\dots (1)$$

$$\text{Total charge } Q = \int_L \rho_L dL = \int_{zA}^{zB} \rho_L dz \dots\dots\dots (2)$$

The electric field intensity  $E$  at point  $P(x, y, z)$

$$dl = dz'$$

$$\begin{aligned} R &= (x, y, z) - (0, 0, z') & \rho &= R \cos \alpha \\ &= xax + yay + (z - z')az & z - z' &= R \sin \alpha \end{aligned}$$

$$(\text{or}) \quad R = \rho a\rho + (z - z')az$$

$$R^2 = |R^2| = x^2 + y^2 + (z - z')^2 = \rho^2 + (z - z')^2$$

$$\frac{a_R}{R^2} = \frac{R}{|R^3|} = \frac{\rho a\rho + (z - z')az}{|\rho^2 + (z - z')^2|^{3/2}} \quad \dots\dots\dots (3)$$

$$E = \frac{\int_L \rho_L dL}{4\pi\epsilon_0 R^2} a_R$$

$$E = \frac{\rho_L}{4\pi\epsilon_0} \int \frac{\rho a\rho + (z - z')az}{(\rho^2 + (z - z')^2)^{3/2}} dz' \quad \dots\dots\dots (4)$$

From fig 21

$$R = [\rho^2 + (z - z')^2]^{1/2} = \rho \sec \alpha$$

$$z' = OT - \rho \tan \alpha$$

$$\tan \alpha = \frac{z - z'}{\rho}$$

$$-dz' = \rho \sec^2 \alpha d\alpha$$

$$dz' = -\rho \sec^2 \alpha d\alpha$$

(4)  $\Rightarrow$  becomes

$$E = \frac{-\rho_L}{4\pi\epsilon_0} \int_{\alpha_1}^{\alpha_2} \frac{\rho \sec^2 \alpha [R \cos \alpha \rho + R \sin \alpha az]}{(\rho^2 \sec^2 \alpha) R} d\alpha$$

$$E = \frac{-\rho_L}{4\pi\epsilon_0 \rho} \int_{\alpha_1}^{\alpha_2} [ \cos \alpha a \rho + \sin \alpha az ] d\alpha$$

$$E = \frac{-\rho_L}{4\pi\epsilon_0 \rho} [ +\sin \alpha a \rho - \cos \alpha az ]_{\alpha_1}^{\alpha_2}$$

$$E = \frac{-\rho_L}{4\pi\epsilon_0 \rho} [ +[\sin \alpha_2 - \sin \alpha_1] a \rho - [\cos \alpha_2 - \cos \alpha_1] az ]$$

Finite line charge

$$E = \frac{\rho_L}{4\pi\epsilon_0 \rho} [ -[\sin \alpha_2 - \sin \alpha_1] a \rho + [\cos \alpha_2 - \cos \alpha_1] az ]$$

.... (A)

Infinite line charge

$$\text{Point B is at } (0,0, \infty) \text{ and A at } (0,0, -\infty) \alpha_1 = \frac{\pi}{2} \alpha_2 = \frac{-\pi}{2}$$

Eqn (A)  $\Rightarrow$

$$E = \frac{\rho_L}{4\pi\epsilon_0 \rho} [ -(-\sin \frac{\pi}{2} - \sin \frac{\pi}{2}) a \rho + 0 ]$$

$$E = \frac{\rho_L}{4\pi\epsilon_0 \rho} 2a \rho = \frac{\rho_L}{2\pi\epsilon_0 \rho} a \rho \text{ v/m}$$

**Electric field intensity of an infinite sheet of charge:**

Infinite sheet of charge in xy plane with charge density  $\rho_s$ .

Total charge with an elemental area (ds) is

$$dQ = \rho_s \cdot ds \longrightarrow (1)$$

Integrate eqn (1)

$$Q = \int_S \rho_s ds \longrightarrow (2)$$

The electric field intensity is expressed in general as

$$E = \frac{Q}{4\pi\epsilon_0 R^2} \mathbf{a}_R \longrightarrow$$

(A)

For a surface charge sub (2) in (A)

$$E = \int_S \frac{\rho_s ds}{4\pi\epsilon_0 R^2} \mathbf{a}_R \longrightarrow (3)$$

Fig22: Evaluation of electric field 'E' due to an infinite sheet of charge.

Find  $ds$ ,  $\mathbf{a}_R$  and  $R$  then substitute in equation (3)

$$R = \rho \mathbf{a}_\rho + h \mathbf{a}_z$$

$$R = -\rho \mathbf{a}_\phi + h \mathbf{a}_z \longrightarrow (4)$$

$$|R| = \sqrt{\rho^2 + h^2} \longrightarrow$$

(4a)

The surface is in xy plane and is given as  $ds = \rho \cdot d\Phi \cdot d\rho \longrightarrow (5)$

$$\mathbf{a}_R = \frac{R}{|R|} \longrightarrow$$

(6)

sub eqn (6), (5), (4) and (4a) in eqn (3)

$$E = \int_0^{2\pi} \int_0^\infty \frac{(-\rho a \rho + h a z) \rho_s}{4 \epsilon_0 \pi (\rho^2 + h^2) (\sqrt{\rho^2 + h^2})} \cdot \rho d\phi \cdot d\rho \longrightarrow$$

(7)

$$0 < \Phi < 2\pi, 0 < \rho < \infty$$

E has only 'z' component  $-\rho a \rho + h a z = h a z \longrightarrow$  (7a)

Sub eqn (7a) in (7)

$$= \int_0^{2\pi} \int_0^\infty \frac{\rho_s h a z \cdot \rho d\phi \cdot d\rho}{4 \pi \epsilon_0 (\rho^2 + h^2) \sqrt{\rho^2 + h^2}}$$

Integrate with respect to  $\Phi$

$$\begin{aligned} &= \frac{\rho_s}{4 \pi \epsilon_0} \int_0^\infty \frac{\rho h a z \cdot d\rho}{(\rho^2 + h^2) \sqrt{\rho^2 + h^2}} [\Phi]_0^{2\pi} \\ &= \frac{\rho_s}{4 \pi \epsilon_0} \int_0^\infty \frac{\rho h a z \cdot d\rho}{(\rho^2 + h^2) \sqrt{\rho^2 + h^2}} [2\pi - 0] \\ &= \frac{2\pi \rho_s h}{4 \pi \epsilon_0} \int_0^\infty \frac{\rho a z \cdot d\rho}{(\rho^2 + h^2) \sqrt{\rho^2 + h^2}} \longrightarrow \end{aligned}$$

(8)

Assume  $\rho^2 + h^2 = u^2 \longrightarrow$

(9)

Diff. eqn (9)

$$2\rho \cdot d\rho = 2u \cdot du \longrightarrow$$

(9a)

$$\rho \cdot d\rho = u \cdot du \longrightarrow \quad (9b)$$

If  $\rho = 0, u = h$  and  $\rho = \infty, u = \infty \longrightarrow$  (9c)

substitute eqn (9b) and (9c) in eqn (8)

$$\begin{aligned} &= \frac{\rho_s h}{2 \epsilon_0} \int_h^\infty \frac{u \cdot du \cdot a z}{(u^2) \times \sqrt{u^2}} \longrightarrow \quad (10) \\ &= \frac{\rho_s h}{2 \epsilon_0} \int_h^\infty \frac{u \cdot du \cdot a z}{(u^2) \times u} \\ &= \frac{\rho_s h}{2 \epsilon_0} \int_h^\infty u^{-2} du \cdot a z \end{aligned}$$

$$\begin{aligned}
&= \frac{\rho_s h}{2\epsilon_0} \left[ \frac{u^{-1}}{-1} \right]_{\infty}^0 \cdot aZ \\
&= \frac{\rho_s h}{2\epsilon_0} \left[ \frac{-1}{u} \right]_{\infty}^0 \cdot aZ \\
&= \frac{\rho_s h}{2\epsilon_0} \cdot aZ \left[ \frac{-1}{\infty} + \frac{1}{h} \right]
\end{aligned}$$

$$E = \frac{\rho_s h}{2\epsilon_0} \times \frac{1}{h} aZ = \frac{\rho_s aZ}{2\epsilon_0} \longrightarrow$$

(11)

$$\mathbf{E} = \frac{\rho_s}{2\epsilon_0} \mathbf{a}_z$$

E has only 'z' component if charge is in the xy plane equation (11) is valid for  $h > 0$ , for  $h < 0$   $a_z$  is replaced by  $-a_z$

### Infinite sheet of charge

The electric field due to infinite sheet of charge is everywhere normal to the surface and its magnitude is independent of the distance of a point from plane containing the sheet of charge

$$E = \frac{\rho_s}{2\epsilon_0} a_n$$

$a_n \rightarrow$  unit vector normal to the sheet

### Electric field due to charged circular ring

Fig :23 The charged circular ring

The charged circular ring of radius ‘ $\rho$ ’ is shown in fig. The ring is placed in xy plane and carrying the charge density is  $\rho_l$  c/m [ uniformly distributed ].

The electric field intensity ‘E’ is measured at point p which is of distance ‘z’ from origin.

Consider a small differential length  $dl$  on this ring. The total charge on it is

$$dQ = \rho_l dl \longrightarrow (1)$$

Integrate eqn (1)

$$Q = \int \rho_l dl \longrightarrow (1a)$$

The electric field due to line charge is  $E = \int \frac{\rho_l dl}{4\pi\epsilon_0 R^2} \cdot \overline{aR} \longrightarrow (2)$

$R$  = distance between p and  $dl$  ,  $dl$  in  $\Phi$  direction

$$dl = \rho d\Phi \longrightarrow (3)$$

$$R^2 = \rho^2 + h^2$$

1) ‘ $\rho$ ’ is in the direction of  $-\rho \mathbf{a}_\rho$  radially inwards (- $\rho \mathbf{a}_\rho$ )

2)  $h$  is in the direction  $\mathbf{a}_z$  ie  $h \mathbf{a}_z$

$$\overline{R} = -\rho \mathbf{a}_\rho + h \mathbf{a}_z \longrightarrow (4)$$

$$|R| = \sqrt{(-\rho)^2 + h^2} = \sqrt{\rho^2 + h^2} \longrightarrow (5)$$

$$\overline{aR} = \frac{-\rho \mathbf{a}_\rho + h \mathbf{a}_z}{\sqrt{\rho^2 + h^2}} \longrightarrow (6)$$

sub eqn (3), (4), (5) and (6) in eqn (2)  $0 < \Phi < 2\pi$

$$E = \int_0^{2\pi} \frac{\rho_l \rho d\phi}{4\pi\epsilon_0(\rho^2 + h^2)} \times \frac{-\rho \mathbf{a}_\rho + h \mathbf{a}_z}{\sqrt{\rho^2 + h^2}} \longrightarrow (7)$$

The radial components of ‘E’ at point ‘p’ will be symmetrically placed in the xy plane and are cancel each other

Hence the vector  $R = -\rho \mathbf{a}_\rho + h \mathbf{a}_z$

$$\mathbf{R} = h \mathbf{a}_z \longrightarrow (8) \quad [\text{since } -\rho a \rho = 0]$$

Eqn (7) is reduced by

$$\begin{aligned} &= \frac{\rho l}{4\pi\epsilon_0} \int_0^{2\pi} \frac{\rho h a_z}{(\rho^2 + h^2)^{3/2}} \cdot d\Phi \\ &= \frac{\rho l}{4\pi\epsilon_0} \frac{\rho h a_z}{(\rho^2 + h^2)^{3/2}} [\Phi]_0^{2\pi} \\ &= \frac{\rho l}{4\pi\epsilon_0} \frac{\rho h a_z}{(\rho^2 + h^2)^{3/2}} \cdot 2\pi \\ \mathbf{E} &= \frac{\rho l}{2\epsilon_0} \frac{\rho h}{(\rho^2 + h^2)^{3/2}} \cdot \mathbf{a}_z \longrightarrow (9) \end{aligned}$$
