UNIT-IV

FOURIER TRANSFORMS

Fourier Transforms and its properties

Fourier Transform

We know that the complex form of Fourier integral is

$$f(x) = \frac{1}{-1} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(t) e^{i\lambda(t-x)} dt d\lambda.$$

Replacing λ by s, we get

$$f(x) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-isx} ds \int_{-\infty}^{\infty} f(t) e^{ist} dt.$$

It follows that if

F(s) =
$$\int_{-\sqrt{2\pi}}^{\infty} \int_{-\infty}^{\infty} f(t) e^{ist} dt$$
 (1)

Then,
$$f(x) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} F(s) e^{-isx} ds$$
 -----(2

The function F(s), defined by (1), is called the **Fourier Transform** of f(x). The function f(x), as given by (2), is called the **inverse Fourier Transform** of F(s). The equation (2) is also referred to as the **inversion formula**.

Properties of Fourier Transforms

(1) Linearity Property

If F(s) and G(s) are Fourier Transforms of f(x) and g(x) respectively, then

$$F\{a f(x) + bg(x)\} = a F(s) + bG(s),$$

where a and b are constants.

We have $F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) dx$ $G(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} g(x) dx$

Therefore,

$$F\{a \ f(x) + b \ g(x)\} = \begin{array}{c} 1 & \infty \\ & - & \int e^{isx} \left\{a \ f(x) + b g(x)\right\} dx \\ \sqrt{2\pi - \infty} & 1 & \infty \\ & = a & \int e^{isx} \ f(x) \ dx + b & - - \int e^{isx} \ g(x) \ dx \\ \sqrt{2\pi - \infty} & \sqrt{2\pi - \infty} & \sqrt{2\pi - \infty} \end{array}$$

$$= a \ F(s) + b G(s) \ i.e,$$

 $F\{a f(x) + bg(x)\} = a F(s) + bG(s)$

(2) Shifting Property

(i) If F(s) is the complex Fourier Transform of f(x), then

$$F\{f(x-a)\} = e^{isa} F(s).$$

We have

Now,

$$F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) dx -----(i)$$

OBSER PE OPTUMIZE OUTSPREAL

 $F\{f(x-a)\} = \int e^{isx} f(x-a) dx$

√2π -∞

Putting x-a = t, we have

$$F\{f(x-a)\} = \begin{array}{c} \frac{1}{\sqrt{2\pi}} & \infty \\ \sqrt{2\pi} & -\infty \end{array}$$

$$= e^{ias} \underbrace{\begin{array}{c} 1 & \infty \\ \sqrt{2\pi} & -\infty \end{array}}_{\sqrt{2\pi} & -\infty} e^{ist} f(t) dt.$$

$$= e^{ias} . F(s).$$
 (by (i)).

(ii) If F(s) is the complex Fourier Transform of f(x), then

Now,
$$F\{e^{iax} f(x)\} = \int_{0}^{\infty} e^{isx} \cdot e^{iax} f(x) dx.$$

$$\sqrt{2\pi} - \infty$$

$$= \int_{0}^{\infty} e^{i(s+a)x} \cdot f(x) dx.$$

$$\sqrt{2\pi} - \infty$$

$$= F(s+a) \qquad \text{by (i) } .$$

(3) Change of scale property

If F(s) is the complex Fourier transform of f(x), then

$$F\{f(ax)\} = 1/a F(s/a), a \neq 0.$$

We have
$$F(s) = \frac{1}{\int e^{isx} f(x) dx} - \frac{1}{\sqrt{2\pi} - \infty}$$

Now,
$$F\{f(ax)\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(ax) dx.$$

Put ax = t, so that dx = dt/a.

$$\therefore F\{f(ax)\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{ist/a} .f(t) dt/a .$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{i(s/a)t} .f(t) dt .a$$

1

$$=$$
 - . $F(s/a)$. (by (i)).a

(4) Modulation theorem.

If F(s) is the complex Fourier transform of f(x), Then

$$F{f(x) cosax} = \frac{1}{2}{F(s+a) + F(s-a)}.$$

We have

$$F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) dx$$

Now,

$$F\{f(x) \cos ax\} = \frac{\int e^{isx} \cdot f(x) \cos ax. dx.}{\sqrt{2\pi} - \infty}$$

$(5) \ n^{\text{th}} \, \text{derivative of the Fourier Transform}$

If F(s) is the complex Fourier Transform of f(x), Then

$$F\{x^n f(x)\} = (-i)^n d^n/ds^n .F(s).$$

We have

$$F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f(x) dx ------(i)$$

Differentiating (i) "n" times w.r.t "s", we get

$$d^{n} F(s) = 1 \quad \infty$$

$$= \int (ix)^{n} \cdot e^{isx} f(x) dx$$

$$= \frac{(i)^{n} \quad \infty}{\int e^{isx} \{x^{n} f(x)\} dx}$$

$$= (i)^{n} F\{x^{n} f(x)\}.$$

$$\Rightarrow F\{x^{n} f(x)\} = 1 \quad d^{n} F(s)$$

$$(i)^{n} ds^{n}$$

$$i.e, F\{x^{n} f(x)\} = (-i)^{n} \int ds^{n}$$

$$d^{n}$$

$$d^{n}$$

$$d^{n}$$

$$d^{n}$$

$$d^{n}$$

$$d^{n}$$

$$d^{n}$$

(6) Fourier Transform of the derivatives of a function.

If F(s) is the complex Fourier Transform of f(x), Then,

$$F\{f_{,,,}(x)\} = -is F(s) \text{ if } f(x) \rightarrow 0 \text{ as } x \rightarrow \pm \infty.$$

We have
$$F(s) = \int e^{isx} f(x) dx$$
.

Now,
$$F\{f_{n}(x)\} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} f_{n}(x) dx.$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{isx} d\{f(x)\}.$$

$$\frac{1}{\sqrt{2\pi}} \begin{cases} & \infty & \infty \\ & e^{isx}.f(x) & -is \int\limits_{-\infty}^{\infty} f(x). \ e^{isx} \ dx. \end{cases}$$

Then the Fourier Transform of f "(x),

i.e,
$$F\{f''(x)\}=$$

$$\int e^{isx} f''(x) dx.$$

$$\int e^{isx} d\{f''(x)\}.$$

i.e, $F\{f''(x)\} = (-is)^2 \cdot F(s)$, Provided $f, f'' \rightarrow 0$.

 $= (-is)^2 . F(s).$

In general, the Fourier transform of the nth derivative of f(x) is given byF{f

$$^{n}(x)$$
} = $(-is)^{n} F(s)$,

provided the first "n-1" derivatives vanish as x $\rightarrow\!\!\pm\!\infty$.

Property (7)

If F(s) is the complex Fourier Transform of f(x), then F
$$\int f(x)dx = \frac{F(s)}{a}$$
 (-is)

Let
$$g(x) = \int_{a}^{x} f(x) dx$$
.

Then,
$$g''(x) = f(x)$$
. -----(i)

Now

$$f[g_{,,}(x)] = (-is) G(s)$$
, by property (6).

$$= (-is). F\{g(x)\}$$

$$= (-is). F \qquad \int_{a}^{x} f(x) dx$$

$$i.e, F\{g''(x)\} = (-is). F \qquad \int_{a}^{x} f(x) dx$$

i.e, F
$$\int_{-1}^{1} f(x) dx = \int_{-1}^{1} F\{g``(x)\}.a$$

Thus,
$$F \int f(x) dx = \frac{F(s)}{a}$$
.

Property (8)

If F(s) is the complex Fourier transform of f(x),

Then, $F\{f(-x)\} = F(s)$, where bar denotes complex conjugate.

Proof

$$F(s) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{-isx} dx.$$

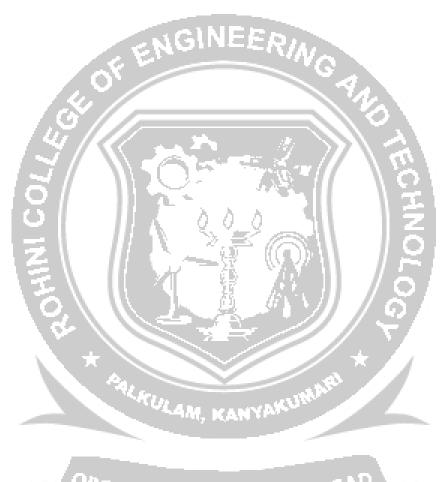

Putting x = -t, we get

$$\frac{1}{F(s)} = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(-t) e^{isx} dt.$$

 $= F\{f(-x)\}.$

Note: If $F\{f(x)\} = F(s)$, then

- (i) $F\{f(-x)\} = F(-s)$.
- (ii) $F\{f(x)\} = F(-s)$.
